

create a prompt example for sequential prompting - how to build myself in AI in next 3 months

Here is a **ready-to-use sequential prompting example** for a 3-month AI learning and career-building journey. You can give each prompt to ChatGPT one after another so that each step builds on the previous result.

Sequential Prompt: “Build Myself in AI in the Next 3 Months”

Prompt 1 — Assess my current level

Step 1 — AI Skill Assessment

Act as an AI career mentor and assess my current skills, experience, and background.

My goal is to build myself into a strong AI professional within the next 3 months.

First, ask me 10 important questions about:

- My current technical skills
- Python knowledge
- Generative AI knowledge
- Automation experience
- APIs and REST APIs
- FastAPI/Streamlit experience
- Cloud knowledge
- Current job experience
- Available learning time per day
- My desired AI career role

After collecting my answers, identify:

1. My current skill level
2. My strengths
3. My weaknesses
4. The most important skills I should learn
5. Skills I should NOT spend time on right now
6. Suitable AI career paths for me

Do not create the 3-month plan yet. First complete the assessment.

Prompt 2 — Create my 3-month roadmap

Step 2 — 3-Month AI Roadmap

Using my assessment from the previous step, create a practical 90-day AI learning roadmap.

Divide the roadmap into:

Month 1 — Foundation

Month 2 — Building AI Applications

Month 3 — Advanced Projects and Career Preparation

For every week, provide:

- Topics to learn
- Concepts to understand
- Python/AI tools to practice
- Hands-on exercises
- One mini-project
- Expected outcome
- Estimated daily time

Prioritize practical skills over theory.

The roadmap should focus on skills that can help me become employable in AI/GenAI and should build progressively from beginner/intermediate level to project-ready level.

Do not overload me with too many technologies. Select the most valuable technologies based on my current background.

Prompt 3 — Build my daily schedule

Step 3 — Daily AI Learning Plan

Convert my 90-day roadmap into a day-by-day learning schedule.

Assume I can spend 2 hours per day.

For each day provide:

- Learning topic

- 30–45 minute theory section
- 45–60 minute hands-on coding task
- 15–30 minute revision/task
- Expected result

Include weekly revision and assessment days.

Every Sunday, give me:

- A weekly test
- 5 technical questions
- 1 coding challenge
- 1 mini-project task
- A scorecard

Make the difficulty gradually increase throughout the 90 days.

Prompt 4 — Learn GenAI practically

Step 4 — GenAI Practical Learning

Act as my personal Generative AI instructor.

Teach me Generative AI progressively using practical examples.

Cover the most important concepts, including:

- LLM fundamentals
- Prompt engineering
- Sequential prompting
- Few-shot prompting
- Structured prompting
- Embeddings
- Vector databases
- RAG
- Function/tool calling
- AI agents
- APIs
- Local LLMs
- Ollama
- Model selection

- Evaluation
- Basic AI application deployment

For every topic:

1. Explain it simply
2. Show a real-world example
3. Give me Python code
4. Give me a hands-on exercise
5. Give me a mini-project
6. Test my understanding

Teach one topic at a time and wait for my response before moving to the next topic.

Prompt 5 — Build portfolio projects

Step 5 — AI Portfolio Projects

Based on my 90-day AI roadmap, design 5 practical AI projects that I can add to my GitHub and resume.

Projects should progressively increase in difficulty.

For each project provide:

- Project name
- Business problem
- Proposed AI solution
- Technologies
- Architecture
- Folder structure
- Development steps
- Python components
- API requirements
- UI requirements
- Testing approach
- Deployment approach
- README structure
- Resume bullet points

At least one project should combine Python automation, REST API, FastAPI, Generative AI, and an LLM.

Make the projects realistic enough to discuss in an AI interview.

Prompt 6 — Build an AI project with me

Step 6 — AI Project Mentor

Act as my senior AI engineer and mentor.

Take the first project from my portfolio roadmap and help me build it from scratch.

Do not give me the entire solution at once.

Follow this sequence:

Step 1 — Define requirements

Step 2 — Design architecture

Step 3 — Create project structure

Step 4 — Set up Python environment

Step 5 — Develop the core Python code

Step 6 — Integrate the LLM

Step 7 — Create FastAPI endpoints

Step 8 — Create the UI

Step 9 — Add error handling

Step 10 — Add logging

Step 11 — Test the application

Step 12 — Create README

Step 13 — Prepare GitHub repository

Step 14 — Prepare resume/project explanation

Step 15 — Prepare interview questions

At every step, explain what I am doing and why.

Wait for my confirmation before moving to the next major step.

Prompt 7 — Become interview-ready

Step 7 — AI Interview Preparation

Act as an AI technical interviewer.

Based on everything I learned during my 90-day AI journey, prepare me for AI/GenAI interviews.

Test me on:

- Python
- Generative AI
- Prompt engineering
- LLMs
- RAG
- Embeddings
- Vector databases
- AI agents
- FastAPI
- REST APIs
- Automation
- AI application architecture
- Deployment
- My portfolio projects

Start with beginner questions and gradually increase the difficulty.

For every answer I give:

- Evaluate my answer
- Give me a score out of 10
- Explain what I missed
- Give me an improved interview answer
- Ask the next question

Also include scenario-based and real-world troubleshooting questions.

Final Prompt — Track my transformation

Step 8 — 90-Day AI Progress Coach

Act as my personal AI career coach for the next 90 days.

Maintain a continuous focus on helping me become job-ready in AI/Generative AI.

At the end of every week, evaluate:

- What I learned
- What I built
- What I understood
- What I struggled with
- My coding progress
- My GenAI knowledge
- My project progress
- My interview readiness

Give me a score out of 100 and identify the top 3 areas I should improve during the following week.

If I fall behind, intelligently adjust my schedule rather than increasing the workload excessively.

My final goal after 90 days is to have:

1. Strong practical AI/GenAI fundamentals
2. Good Python and API development skills
3. Multiple AI projects
4. A GitHub portfolio
5. An AI-focused resume
6. Interview confidence
7. At least one end-to-end production-style GenAI application

Keep me focused on practical, career-relevant skills rather than learning technologies just for the sake of learning them.

The key idea of sequential prompting is: Assess → Plan → Learn → Practice → Build → Test → Improve → Interview. This prevents one huge prompt from producing a generic AI roadmap and instead makes each response depend on the previous stage.
